

Are you planning to have a COVID-19 vaccine?

You can help medical researchers uncover how immunity to the disease, and vaccination, develops.

We are looking for participants who have not had exposure to COVID-19 but who intend to receive a COVID-19 vaccine. We will follow these participants before and after vaccination, to measure changes in their immune responses over time.

By comparing an individual's immune response before and after vaccination to those who acquired an immune response as the result of a COVID-19 infection, we hope to better understand how immunity to COVID-19 and vaccination develops and how long it lasts.

This knowledge will help inform decisions on vaccine development and other public health measures to control the virus.
