PhD in Affective Neuroscience 2018

**Bugs and Brains Study**

Have you ever wondered whether gut bacteria (and gut health) is associated with mental and physical health?

An enthusiastic and motivated candidate is sought for a PhD project beginning in the first half of 2018. The project is a joint initiative of the Melbourne Neuropsychiatry Centre (Department of Psychiatry), the Melbourne School of Psychological Sciences, the Melbourne Dental School, and the Department of Biochemistry and Molecular Biology.

The successful candidate will have the opportunity to craft a thesis topic that suits their interests, and may utilise a range of data being collected, including bacterial, endocrine, immune, metabolic, and gut and mental health data.

Applicants should have an undergraduate and honours degree in a relevant field, and have excellent results (first class honours or equivalent).
